This is a letter of recommendation for Wolfe's Metal Fabrication

Simply stated : If you have a metal project – most any type of metal – that you need help on - This is the place to go. I have owned 4 patents and the hardest thing I have found is getting people to think outside of the box. With my latest gadget that is now pending – I literally had at least eight or ten companies tell me what I was trying to do could not be done - and these were not small companies.

Thank goodness for Google – after continuing to research for answers I found Wolfe's Metal Fabrication – and really what I found is Brian Wolfe. Wolfe's metals have now made me two machines that do what others said could not be done. Here is what I think Wolfe's Metals has to offer:

- Someone that listens to your needs
- Someone that will brainstorm with you for possible solutions
- Someone that is not afraid of trying and possibly failing
- Someone that thinks outside of the typical box
- Keeps you informed on progress
- Keeps you informed on costs
- Delivers a working solution to your needs
- Economics and your budget are always in the equation

Brian Wolfe is really good to work with. On more than one occasion I would discuss a challenging situation with him and just leave it with him – knowing that his brain is working to come up with a good solution that also has economics in mind. I have received emails at very late and very early times – He never quits until every possible solution has been at least tested in his thinking.

My background is not in metals and Brian helped me understand what metal could do and just as important what it can't do. Brian has always supplied me with a teaching video that I use to train our people in the plant that also addresses preventive maintenance on the tool.

I highly recommend Wolfe's Metals for any of you Metal Fabricating needs!
